

Enerdrive Pro Series Power Systems:

After 2 years of research, testing and proving, and a further 8+ years of infield sales, we have designed and created a COMPLETE Lithium Battery & Installation System so your Li-Ion battery bank is fully protected. Most importantly, our system is designed to give the maximum performance, longevity and SAFETY in your valuable installations.

Be aware that the market is abuzz with the hot topic of Lithium Ion Batteries; and we can tell you from our testing to date that all the hype of their performance and capabilities is TRUE. However what we can also inform you is that all the stories of their 'Issues' are unfortunately also true. However, the so called "issues" of lithium can be avoided with some very basic rules about protection.....

- Never go over voltage whilst charging them
- Never let them go 'Dead' Flat
- Keep the individual cells 'Balanced'

What this lesson taught us is if we were to develop a Complete Lithium Package – IT HAD TO BE DONE RIGHT. So we developed our own Lithium Power Pack for the Australian market with the emphasis on 'built like a tank'; and even to the extent of being a little bit 'overkill' on the packaging and protection. So how does our system actually work? The Advance BMS relay driver is designed to take multiple signal input connections from the ePRO Plus battery meter for low state of charge (SOC%) & system voltage & Hi/Low Cell voltage from the batteries Active Cell Balancer unit and control all charging and discharging sources connected to the lithium battery system.

8 years on this functionality has evolved and forever improved to what it is today. We are the market leader in complete Lithium Power solutions for anything with wheels including 4x4, Caravans, Marine and numerous commercial applications. This success is largely due to our commission process which is a necessary requirement of every Pro Series System we sell.

Important Information:

If you are considering buying an Enerdrive Pro Series Power system you need to first understand the commission process and ensure you are comfortable with the process.

When the installation is complete you are required to complete the commission procedure in order to ensure the system is fitted correctly and the Enerdrive fail safes built into the system are functional.

This is the only way to ensure many years of trouble-free use. The great news is you are not on your own. Our highly skilled technical support team are available to assist via the phone or email. You can even connect via Teams or Face Time for additional support if required.

Enerdrive Pro Series System are easier than ever before to install. The majority of the components are pre-assembled and ready to go. This makes for a fairly simple installation process.

We request that when your installation is complete you reach out to our team for a quick consultation and send images of the final installation to us for filing. Our intention is to be as best prepared as possible to offer system support for the life of the system.
